beginning in the mid 1980 s vlsi technology had begun to advance in two directions pushing the limit of integration ulsi ultra large scale integration represents the frontier of the semiconductor processing technology in the campaign to conquer the submicron realm the application of ulsi however is at present largely confined in the area of memory designs and as such its impact on traditional microprocessor based system design is modest if advancement in this direction is merely a natural extrapolation from the previous integration generations then the rise of asic application specific integrated circuit is an unequivocal signal that a directional change in the discipline of system design is in effect in contrast to ulsi asic employs only well proven technology and hence is usually at least one generation behind the most advanced processing technology in spite of this apparent disadvantage asic has become the mainstream of vlsi design and the technology base of numerous entrepreneurial opportunities ranging from pc clones to supercomputers unlike ulsi whose complexity can be hidden inside a memory chip or a standard component and thus can be accommodated by traditional system design methods asic requires system designers to master a much larger body of knowledge spanning from processing technology and circuit techniques to architecture principles and algorithm characteristics integrating knowledge in these various areas has become the precondition for integrating devices and functions into an asic chip in a market oriented environment but knowledge is of two kinds
